

Figure S2. Knockdown of CHSY1 suppresses PDGF-induced cell proliferation. Control and CHSY1 silenced A172 cells were cultured in low serum condition (1% of FBS) and treated with PDGF (20 ng/ml) or EGF (20 ng/ml) for 48 hours. Cells were immunofluorescently stained for Ki67 and Ki67–positive cells were counted under a microscope. Representative images are shown. Scale bar 100 μ m
